No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

IS-09-229-037-30

Sequence 30, Application US/09229037A

Sequence 30, Application US/09229037A

Patent No. 6534261

APPLICANT: Case, Casey Christopher

APPLICANT: Eisenberg, Stephen P.

APPLICANT: Sardamo Biosciences, Inc.

TITLE OF INVENTION: Regulation of Endogenous Gene Expression in Cells Using

TITLE OF INVENTION: Angulation of Endogenous Frice Repression in Cells Using

TITLE OF INVENTION: 21nc Finger Proteins

FILE REFERENCE: 019496-002200US

CURRENT APPLICANT: 1999-01-12

NUMBER OF SEQ ID NOS: 40

SOFTWARE PATENTING DATE: 1999-01-12

SOFTWARE PATENTING DATE: 1999-01-12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 17, Application US/09478681

Sequence 17, Application US/09478681

Patent No. 6607882

GENERAL INFORMATION:
APPLICANT: Case, Casey Christopher
APPLICANT: Case, Casey Christopher
APPLICANT: Eisenberg, Stephen P.
APPLICANT: Spratt, Sharon K.
TITLE OF INVENTION: NSGULATION OF ENDOGENOUS GENE EXPRESSION IN CELLS
TITLE OF INVENTION: USING ZINC FINGER PROTEINS
FILE REFERENCE: 8125-0002.10 / S2-US3

CURRENT APPLICATION UNMER: US/09/478,681

CURRENT FILING DATE: 2000-01-06
                                                                                                                                                                                                                                                                                             OTHER INFORMATION: Description of Artificial Sequence: VEGF3a ZFP A. OTHER INFORMATION: construct targeting downstream 9-base pair target CTHER INFORMATION: site in VEGF promoter US-09-229-037-17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FEATURE:

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 21, Application US/09731558

Sequence 21, Application US/09731558

Patent No. 6503717

GENERAL INFORMATION:
APPLICANT: Case, Casey Christopher
APPLICANT: Liu, Qiang
APPLICANT: Babar, Edward J.
APPLICANT: Rebar, Edward J.
TITLE OF INVENTION: Methods of Using Randomized Libraries of Zinc Finger
TITLE OF INVENTION: Proteins for the Identification of Gene Function
FILE REFERENCE: 019496-003210US
CURRENT APPLICATION NUMBER: US/09/731,558
CURRENT PILING DATE: 2000-12-06
PRIOR FILING DATE: 1999-12-06
NUMBER OF SEQ ID NOS: 24

SOFTWARE: PATENTIN VEV. 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 21, Appl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                      December 27, 2004, 18:12:11; Search time 15.9 Seconds (without alignments) 29.197 Million cell updates/sec

Sequence 14, Application US/09731558
Patent No. 6503717
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Liu, Qiang
APPLICANT: Liu, Qiang
APPLICANT: Sangamo Biosciences, Inc.
TITLE OF INVENTION: Methods of Using Randomized Libraries of Zinc Finger
TITLE OF INVENTION: Preteins for the Identification of Gene Function
FILE REFERENCE: 019496-003210US
CURRENT APPLICATION NUMBER: US/09/731,558
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                      December 27, 2004, 18:12:11; Search time 15:9 Seconds (without alignments) 29:197 Million cell updates/sec

Squence 30, Application US/09229037A

Patent No. 6534261

GENERAL INFORMATION:

APPLICANT: Cox III, George No. 6534261bert

APPLICANT: Eisenberg, Stephen P.

APPLICANT: Spratt, Sharon Kaye

APPLICANT: Spratt, Sharon Kaye

APPLICANT: Spratt, Sharon Raye

APPLICANT: Spratt, Sharon Raye

APPLICANT: Spratt, Sharon Raye

TITLE OF INVENTION: Regulation of Endogenous Gene Expression in Cells Using

TITLE OF INVENTION: Line Finger Proteins

TITLE OF INVENTION: 2inc Finger Proteins

TILE REFERENCE: 019496-002200US

CURRENT FILING DATE: 1999-01-12

NUMBER OF SEQ ID NOS: 40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-09-478-681-15

Sequence 15, Application US/09478681

Sequence 15, Application Case, Casey Christopher

APPLICANT: Case, Casey Christopher

APPLICANT: Gast, Casey Christopher

APPLICANT: Spratt, Sharon K.

TITLE OF INVENTION: REGILATION OF ENDOGENOUS GENE EXPRESSION IN CELLS

TITLE OF INVENTION: USING ZING FINGER PROTEINS

FILE REFERENCE: 8325-0002.10 / S2-US3

CURRENT PAPLICATION NUMBER: US/09/478,681

CURRENT PILING DATE: 2000-01-06

NUMBER OF SEQ ID NOS: 43

SOOTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20, Application US/09731558

Sequence 20, Application US/09731558

Patent No. 650377

GENERAL INFORMATION:

APPLICANT: Case, Casey Christopher

APPLICANT: Edward J.

APPLICANT: Sangamo Biodecences, Inc.

TITLE OF INVENTION: Methods of Using Randomized Libraries of Zinc Finger

TITLE OF INVENTION: Proteins for the Identification of Gene Function

FILE REFERENCE: 019496-003210US

CURRENT APPLICATION NUMBER: US/09/731,558

CURRENT FILING DATE: 2000-12-06

PRIOR PRING DATE: 1999-12-06

NUMBER: OF SEQ ID NOS: 24-12-06
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Appl

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 19, Application US/09731558

Sequence 19, Application US/09731558

Patent No. 6503717

GENERAL INFORMATION:

APPLICANT: Case, Casey Christopher

APPLICANT: Case, Casey Christopher

APPLICANT: Bangamo Biosciences, Inc.

APPLICANT: Sangamo Biosciences, Inc.

APPLICANT: Sangamo Biosciences, Inc.

TITLE OF INVENTION: Methods of Using Randomized Libraries of Zinc Finger

TITLE OF INVENTION: Proteins for the Identification of Gene Function

FILE REFERENCE: 019496-003210US

CURRENT APPLICATION NUMBER: US/09/731,558

CURRENT FILING DATE: 1999-12-06

MUMBER OF SEQ ID NOS: 24

SOFTWARE: PatentIn Ver. 2.1

SEQ ID NO 19

LENGTH: 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 19, Appl

ALIGNMENTS

New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus. Zinc finger protein; ZFP; DNA binding protein; zinc finger. Zinc finger protein related peptide motif SEQ ID NO:814. ABP49026 ID ABP49026 standard; peptide; 7 AA. (SANG-) SANGAMO BIOSCIENCES INC. 20-NOV-2001; 2001WO-US043438. 20-NOV-2000; 2000US-00716637. 28-AUG-2002 (first entry) WPI; 2002-500284/53. WO200242459-A2. 30-MAY-2002. Liu Q;

Example 1; Page 45; 81pp; English

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from N-terminus where the target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (M); (2) a polymuclecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S2 target subsite, selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to the S4 target subsite, thus designing (I) that binds to he S4 target subsite, thus designing (I) that binds to he S4 target subsite, thus designing (I) that binds to he S4 target subsite that it binds to the S6 target subsite of the subsite such that it binds to the S6 target subsite of the subsite such that it binds to the S6 target subsite sharing the nucleotide G in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human therapeutics and plant

```
The present invention describes a zinc finger protein (I) that binds to a carget site, comprising a first (F1), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3.5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and (S1) carget subsite, as electing the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it binds to the S3 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to the H8 starget site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5' most position of the subsite. (I) is useful in studying gene function, and for human therapeutics and plant conginate the expression of a target region within a subject, in modulate the expression of a target region within a subject, in a sample, and in assays to determined the phenotype and function of in a sample.
                                                                                                                                                                                                                                                                           ö
engineering. (I), (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced biological activity, ABQ71213 to ABQ72214 and ABP48191 to ABP5130 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         engineering, comprises N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       useful in studying

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) and cainc finger, ordered FT, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (CT) comprising (I); (2) a polyhucleotide (III) encoding (I) or (II); and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F2 zinc finger such that it that it binds to the S3 target subsite, thus designing (I) that binds to that it binds to the S3 target subsite, thus designing (I) that binds to that it binds to the S3 target subsite, thus designing (I) that binds to the tit binds to the S3 target subsite, thus designing (I) that binds to useful in studying gene function, and for human therapeutic and plant engineering (I), (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of an assays to determined biological activity ABG71213 to target sequences, as well as enhanced biological activity ABG71213 to ABG72214 and ABB78191 to ABB78210 represent in the exemplification of the present
                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
gene expression. (1) has improved affinity and specificity for their target sequences, as well as enhanced biological activity, ABQ12131 to ABQ72214 and ABP48191 to ABG51230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present

Also described are: (1) a polypeptide (II) comprising (I); (2) a polymucleotide (III) encoding (I) or (II); and (C) in comprising (I); (2) a polymucleotide (III) encoding (I) or (III); and (C) binds to the S1 target subsite, selecting the F1 zinc finger such that it binds to the S3 target subsite, selecting the F2 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites (C) a target site. (I) is useful for recognition of the subsite. (I) is useful in studying gene function, and for human therapeutics and plant engineering. (I), (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within a subject, in c diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced biological activity. AB071213 to their therefore the peptides which are given in the exemplification of the present
                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a zinc finger protein (I) that binds to

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) inc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the carget site comprises, in 3.-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it compacts to the S1 target subsite, and selecting the F3 zinc finger such that it compacts to the S1 target subsite, and selecting the F3 zinc finger such that it compacts to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, and selecting the F3 zinc finger such that it compacts to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, and for human therapeutics and plant considering (I) (II) or (III) is useful in studying gene function, and for human therapeutics and plant companies for sequence specific detection of target nucleic acid adaptostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of gene expression (I) has improved affinity and specificity for their carget sequences, as well as enhanced biological activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a zinc finger protein (1) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) and carrier site, comprising a first (F1), a second (F2), and a third (F3) are carrier site to comprises, in 3'-5' firom N-terminus to C-terminus, where the carget site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (I1) comprising (I1); (2) a polymuclectide (I11) encoding (I) or (I1); and (I) involves selecting the F1 zinc finger such that it binds to the S2 target subsite, and selecting the F2 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites are such a target site. (I) is useful for recognition of the subsite. (I) is useful in studying gene function, and for human therapeutic methods to modulate the expression of a target region within a subject, in modulate the expression of a target region within a subject, in a sample, and in assays to determined the phenotype and function of in a sample, and in assays to determined the phenotype and function of the expression. (I) has improved affinity and specificity for their carriers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced biological activity. AB071213 to AB072214 and ABP48191 to ABP21210 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                 Zinc finger protein; ZFP; DNA binding protein; zinc finger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               h Similarity 100.0%; Score 7; DB 5; Length 7; Similarity 100.0%; Pred. The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) condered F1, F2, F3 from N-terminus to C-terminus, where the carget site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (CI) comprising (I); (2) a polyfuncleotide (III) encoding (I) or (II); and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it comparison (I) is useful for recognition of triplet target subsites that it binds to the S3 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of the subsites of a target site (II) is useful in therapeutic methods to useful in studying gene function, and for human therapeutic and plant endiance (I), (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced biological activity.                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) cordered FI, F2, F3 from N-terminus to C-terminus, where the carget site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (CI) comprising (I); (2) a polynuclectide (III) encoding (I) or (II); and (CI) designing (I); (2) a polynuclectide (III) encoding (I) or (III); and (CI) designing (I); (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it compared to the S2 target subsite, and selecting the F2 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to the S3 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to a target side (I) the S-most position of the subsite. (I) is useful in studying gene function, and for human therapeutic and plant confinence of the S1 target region within a subject, in cinganostic methods for sequence specific detection of target mucleic acid in a sample, and in assays to determined the phenotype and function of the subsite to the arrest sequences as well as enhanced biological activity. AB071213 to their interpret sequences, as well as enhanced biological activity. AB071213 to things the peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                              New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

carget site, comprising a first (F1), a second (F2), and a third (F3) carget site, comprising a first (F1), a second (F2), and a third (F3) cainc finger, ordered F1, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (I1) comprising (I); (2) a polymotleotide (III) encoding (I) or (III); and (S2) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it that it binds to the S3 target subsite, thus designing (I) that binds to the S1 target subsite, and selecting the F3 zinc finger such that it carget site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human therapeutic and plant condulate the expression of a target region within a subject, in city sequence specific detection of target nucleor acid cin a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced biological activity. AB071213 to AB072214 and AB0748191 to AB072214 and Specific appresent DNA target sequences, as well as enhanced biological activity. AB071213 cinvention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      XXXX
                                                                                                                                                                                                                                                                                                                                    The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (F1), a second (F2) and a third (F3) zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (G1), a second (G2), and a third (G3) target subsite. Also described are: (I) a polypeptide (C1) comprising (I); (2) a polyfuclectide (III) encoding (I) or (II); and (C1) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it compress to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S1 target subsite, and selecting of F4 F3 zinc finger such that it compress to the S3 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites (C1) a target selection of triplet carget subsites (C2) modulate the expression of a target region within a subject, in charge technical carget sequences, as well as enhanced biological activity. ABG71213 to CASG72214 and ABG72214 and ABG72214 and ABG72214 or the exemplification of the present carget in the present carget peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                   New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VEGF; chromatin; cytostatic; vasotropic; antidiabetic; ophthalmological; antirheumatic; antiarthritic; antipsoriatic; anti-HIV; antisickling; neuroprotective; nootropic; cerebroprotective; antibacterial; fungicide; virucide; gene therapy; Veg 1; zinc finger.

The invention provides a method of modifying a region of interest in cellular chromatin that involves contacting the cellular chromatin with a cellular chromatin that involves contacting the cellular chromatin with a cellular chromatin that involves contacting the cellular chromatin with a cellular chromatin molecule comprises a DNA binding domain and a component of a chromatin remodeling complex or its functional fragment, which complexes the region of interest. The method is useful for modifying a region of interest. The method is useful for modifying a region of interest. The method is useful for modifying a region of interest correctivated receptor (PPAR-gamma2), pl6, p53, pRb, dystrophin and e-cadebrain in cellular chromatin present in a plant, animal or human cell. The chromatin modification facilitates detection of sequence of interest comprising a single nucleotide polymorphism, cativation or repression of a gene of interest or recombination between an exogenous nucleic acid and cellular chromatin. It also results in generation of an accessible region in the cellular chromatin which carefulating expression of a gene and for binding an exogenous molecule to prophylactic groove binders and intercalators. The fusion molecule may be used for modulating expression of a gene and for binding an exogenous molecule to prophylactic comply to modulate gene expression, for therapeutic or prophylactic complications, e.g., for treating cancer, ischemia, diabetic retinopathy, sickle cell anemia, Alzheimer's disease, muscular degeneration, rheumatoid arthritis, psoriasis, HIV infection, infectious fungus, e.g., chlamydia, Mycobacteria, Pneumococci, infectious fungus, e.g., chlamydia, Mycobacteria, Pneumococci, infectious fungus, e.g., chlamydia, Mycobacteria, Pneumococci, infectious fungus, e.g., chlamydia, psoriasis, e.g., ch

VEGF-1 zinc finger domain F4.

25-MAR-2002 (first entry)

AAB47802;

```
The sequences given in AAB47802-16 represent zinc finger domains derived from transcriptional effector proteins. These transcriptional effector proteins. These transcriptional effector proteins. These transcriptional effector transcriptional initiation site of the human vascular endothelial growth factor (VEGF) gene. Target site #1 was bound by a binding domain containing six zinc fingers, named VEGF31/1. Target site #2 was bound by a three-finger zinc finger domain, VEGF-1, and a control six-finger domain, GATA 15.5, was designed to bind to target sequence #3. The zinc finger containing proteins were used to demonstrate the method of the invention for binding an exception molecule (EM) to a binding site (BS), where the BS is located within a region of interest in cellular chromatin. The method comprises identifying an accessible region within the accessible region, and introducing the EM into the cell, where the EM binds site in cellular chromatin for modulating gene expression by administering an exogenous molecule. The binding of an exogenous molecule contained and site site of containing site in cellular chromatin can be used for detection of a particular sequence, for example, an exogenous molecule, such as a sequence-specific DNA binding protein, can be used to detect variant alleles associated with a disease or with a particular phenotype in the presence of pathological microoraganisms in colinical processions molecule.

in clinical samples. Exogenous molecules can also be used to quantify copy number of a gene in a sample. For example, detection of the loss of one copy of a p53 gene in a clinical sample is an indicator of susceptibility to cancer. The methods can also be used in assays to determine gene function and to determine changes in phenotype resulting from specific modulation of gene expression

The sequences given in AAB47802-16 represent zinc finger domains derived from transcriptional effector proteins. These transcriptional effector proteins. These transcriptional effector proteins were designed to bind to target sites derived from the transcriptional initiation site el was bound by a binding domain of factor (VEGF) gene. Target site #1 was bound by a binding domain containing six zinc finger domain, VEGF2a/1. Target site #2 was bound by a three-finger zinc finger domain, VEGF2a/1. Target site #2 was bound by containing proteins were used to demonstrate the method of the invention for binding an exogenous molecule (EM) to a binding site (BS), where the BS is located within a region of interest in callular chromatin. The method comprises identifying an accessible region within the accessible region of interest, identifying a target site for the EM within the chromatin to the BS. The method is useful for modulating gene expression by administed to the BS. The method is useful for modulating gene expression by administering an exogenous molecule. The binding of an exogenous molecule contained to detect the presence of pathological microorganisms and laless associated with a disease or with a particular spendles and to detect the presence of pathological microorganisms of copy number of a gene in a sample. For example, detection of the loss of copy number of a gene in a sample. For example, detection of the loss of copy number of a gene in a sample. For example, detection of the loss of copy number of a gene in a clinical sample is an indicator of concer. The methods can also be used to quantify for eacestibility to cancer. The methods can also be used to genetic production and to detect the presence of pathological microorganisms determined entaining gene function and to detect the presence of pathological microorganisms determined entaining gene function and to determine the sample of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of the gene and for treating atherosclerosis, ischemia, arthritis, wound or ulcer.
                                                                                                                                                                                      vulnerary;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention

New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of the gene and for treating atherosclerosis, ischemia, arthritis, wound or ulcer.
gene therapy, antiatherosclerotic; vasotropic; antiarthritic; vulnerary; antiulcer; cytostatic; antipsoriatic; antidiabetic; ophthalmological; osteopathic; antiinfertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating anglogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischemaia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention
                                                                                                                                                                                                                                                                                                                      Eisenberg SP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 7;

Patent No. 6794136

GENERAL INFORMATION:

APPLICANT: EISENBERG, Stephen P.

APPLICANT: LIU, Olang

APPLICANT: JAMIESON, Andrew

APPLICANT: MEBRA, Edward

TITLE OF INVENTION: PROTEINS

TITLE OF INVENTION: PROTEINS

TITLE OF INVENTION: BASS-0020

CURRENT APPLICATION NUMBER: US/09/716,637

CURRENT FILING DATE: 2001-10-12

NUMBER OF SEQ ID NOS: 35
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                   December 27, 2004, 17:02:31 ; Search time 15.8 Seconds (without alignments) 29.381 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 15, P

Patent No. 6794136

GENERAL INCORMATION:
APPLICANT: EIGENBERG, Stephen P.
APPLICANT: LIU, Qiang
APPLICANT: LAMIESON, Andrew
APPLICANT: REBAR, Edward
TITLE OF INVENTION: ITERATIVE OPTIMIZATION IN THE DESIGN OF BINDING
TITLE OF INVENTION: PROTEINS
FILE REFERENCE: 8325-0020
CURRENT APPLICATION NUMBER: US/09/716,637
CURRENT FILING DATE: 2001-10-12
NUMBER OF SEQ ID NOS: 35
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1: /cgn2_6/ptodata/1/iaa/5A_COMB.pep:*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 30, Application US/09229037A

Sequence 30, Application US/09229037A

Patent No. 6534261

GENERAL INFORMATION:

APPLICANT: Cox II, George No. 6534261bert

APPLICANT: Case, Casey Christopher

APPLICANT: Elsenberg, Stephen P.

APPLICANT: Sangamo Biosciences, Inc.

APPLICANT: Sangamo Biosciences, Inc.

APPLICANT: Sangamo Biosciences, Inc.

TITLE OF INVENTION: Regulation of Endogenous Gene Expression in Cells Using

TITLE OF INVENTION: Langer Proteins

FILE REFERENCE: 019496-002200US

CURRENT APPLICANTION NUMBER: US/09/229,037A

NUMBER OF SEQ ID NOS: 40

SEGTWARET PLILIG DATE: 1999-01-12

NUMBER PROS: PatentIN Ver. 2.0
                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-09-731-558-18

Sequence 18, Application US/09731558

Patent No. 650317

GENERAL INFORMATION:

APPLICANT: Case, Casey Christopher

APPLICANT: Rangamo Biosciences, Inc.

APPLICANT: Sangamo Biosciences, Inc.

TITLE OF INVENTION: Methods of Using Randomized Libraries of Zinc Finger

TITLE OF INVENTION: Proteins for the Identification of Gene Function

FILE REFERENCE: 019496-0032100S

CURRENT APPLICATION NUMBER: US/09/731,558

CURRENT PLINIG DATE: 2000-12-06

PRIOR FILING DATE: 1999-12-06
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                    (without alignments)
29.381 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 18, R

Sequence 75, Application US/09139762A

Patent No. 6013453

GENERAL INFORMATION:
APPLICANT: Choo, Yen
APPLICANT: Klug, Aaron
APPLICANT: Sanchez Garcia, Isidro
TITLE OF INVENTION: Improvements in or Relating to
TITLE OF INVENTION: Binding Proteins for Recognition of DNA
NUMBER OF SEQUENCES: 125
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADDRESSEE: Pillabury Madison & Sutro, L.L.P. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
